

**Amyotrophic Lateral Sclerosis (ALS)
Quality Measurement Set 2022 Update**

Approved by the ALS Quality Measurement Work Group on April 25, 2022. Approved by the AANI Quality Measure Subcommittee on May 9, 2022. Approved by AANI Quality Committee on May 24, 2022. Approved by AANI Board of Directors on June 16, 2022.

Disclaimer

Quality Measures published by the American Academy of Neurology Institute (AANI) and its affiliates are assessments of current scientific and clinical information provided as an educational service. The information: 1) should not be considered inclusive of all proper treatments, methods of care, or as a statement of the standard of care; 2) is not continually updated and may not reflect the most recent evidence (new evidence may emerge between the time information is developed and when it is published or read); 3) addresses only the question(s) or topic(s) specifically identified; 4) does not mandate any particular course of medical care; and 5) is not intended to substitute for the independent professional judgment of the treating provider, as the information does not account for individual variation among patients. In all cases, the selected course of action should be considered by the treating provider in the context of treating the individual patient. Use of the information is voluntary. AANI provides this information on an “as is” basis, and makes no warranty, expressed or implied, regarding the information. AANI specifically disclaims any warranties of merchantability or fitness for a particular use or purpose. AANI assumes no responsibility for any injury or damage to persons or property arising out of or related to any use of this information or for any errors or omissions.

Amyotrophic Lateral Sclerosis (ALS) Quality Measurement Set 2022 Update

There is opportunity to improve the quality of care provided for patients with ALS and their care partners.¹

The Centers for Disease Control and Prevention (CDC) National Amyotrophic Lateral Sclerosis (ALS) Registry diagnostic category, epidemiologically definite ALS, defines a set of patients with various ALS phenotypes characterized by a specific validated algorithm to integrate patients coming from administrative datasets (commercial insurance, Medicare Advantage, Medicare, Department of Veteran Affairs, patient web-portal self-report).² Prior to the development of this CDC “epidemiologically definite” category, the 1997 Riluzole Advisory³ and the 1999 and 2009 AAN ALS practice parameters^{4,5} used all categories of ALS diagnostic certainty defined by the World Federation of Neurology “El Escorial” criteria for the diagnosis of ALS to include all ALS phenotypes.⁶ Recently an international consensus clarified this consolidation of the characteristics of the different ALS phenotypes under the diagnosis of ALS in the Gold Coast Criteria for the diagnosis of ALS.⁷

It is estimated that ALS affects approximately 5.2 people per 100,000 in the United States, and in 2016, there were 16,424 persons identified as having epidemiologically definite ALS.^{2,8} The exact number of people in the United States diagnosed with ALS is unknown, but it is estimated that each year doctors diagnosis about 5,000 individuals.⁹ In a systematic review of prevalence data for ALS, it was found that worldwide ALS prevalence was 4.42 per 1,000,000 population.¹⁰

Six measures were drafted to capture and measure clinician process and outcomes for patients with ALS:

ALS Quality Measurement Set – 2022 Update
ALS support services
Disease modifying pharmacotherapy (DMP) discussion with patients with ALS
Screening for malnutrition and dysphagia and appropriate referral for patients with ALS
Screening for respiratory impairment and appropriate intervention for patients with ALS
ALS multidisciplinary care plan developed or updated
ALS patient care preferences

Measure Development Process

In 2020, the American Academy of Neurology Institute (AANI) asked a small group of experts to review the 2013 ALS quality measurement set for currency. The small group recommended an update because of new evidence and medications that affected the 2013 measurement set. The AANI seated an ad hoc ALS quality measure development work group charged with updating appropriate quality improvement measures for patients with ALS.

All work group members are required to disclose relationships with industry and other entities to avoid actual, potential, or perceived conflicts of interest (Appendix A). Seated work group members were instructed to abstain from voting on individual measure concepts if a conflict was present.

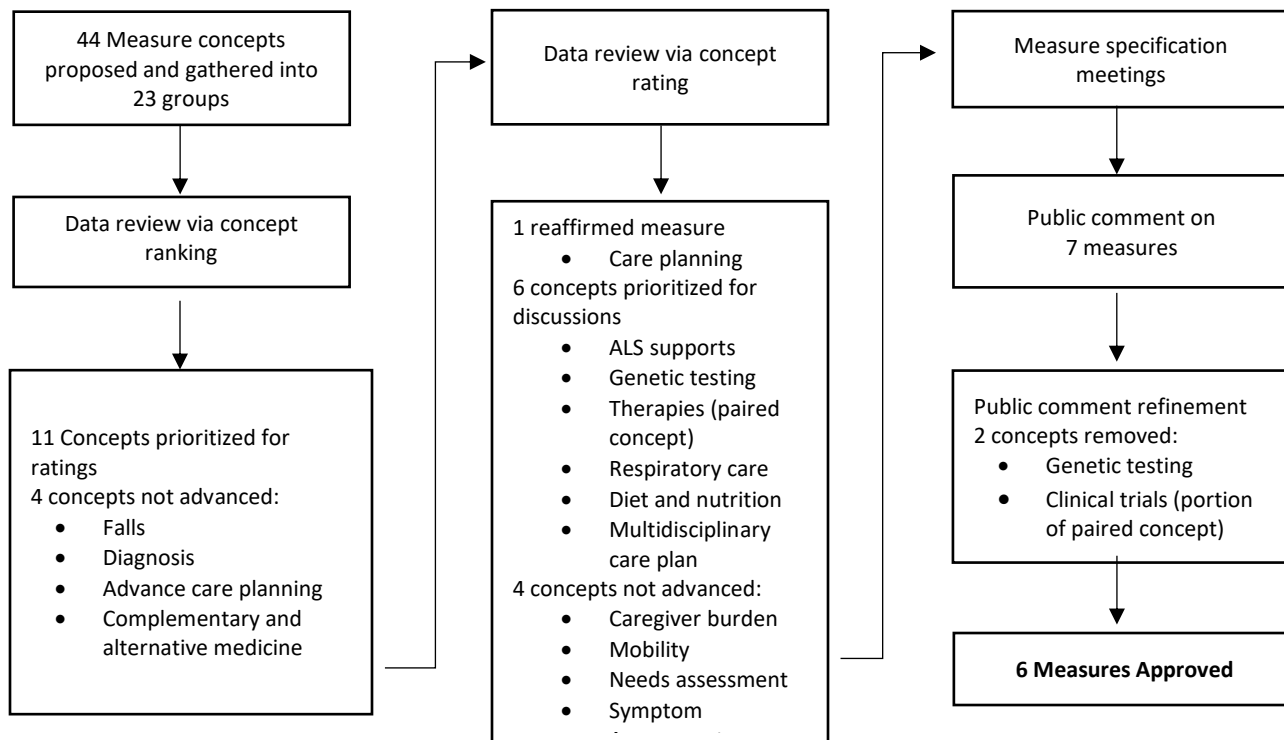

An initial literature search was conducted with the help of a medical librarian and resulted in 925 abstracts identified from EMBASE and MEDLINE. The literature search results were winnowed to 279 articles. These articles included potential guidelines, systematic reviews, meta-analyses, articles containing evidence of gaps in care for patients with ALS, or articles summarizing patient and care partner preferences. The work group also reviewed Axon Registry® performance data on the ALS Patient Care Preferences measure, which is also known as CMS Quality Payment Program (QPP) measure 386.

It is impossible to develop a comprehensive quality measurement set that addresses all the concerns patients with ALS would value. Large measurement sets also pose a challenge for treatment teams to implement and

monitor for quality improvement work. At the start of this update, work groups members were instructed to help winnow draft concepts to focus on measures that were supported by evidence, feasible to implement, and meaningful in practice.

These measures will be reviewed triennially to determine if updates are needed to the measurement set. Full details of the AAN’s measure development process are available online.¹¹ The measures in this set are being made available without any prior testing. The AAN encourages testing of this measurement set for feasibility and reliability by organizations or individuals positioned to do so. **Only following measure testing will measures be eligible for potential submission to Centers for Medicare & Medicaid Services (CMS) for consideration in Quality Payment Program’s (QPP) Merit-based Incentive Payment System (MIPS) and the National Quality Forum for possible endorsement.** Prior to any submission, beta testing will need to occur.

The following image summarizes the steps in the measure development process.

Other Measure Concepts

The 2013 ALS Quality Measurement Set was identified for update during the triennial review of evidence.

Amyotrophic Lateral Sclerosis Quality Measurement Set - 2013

- ALS multidisciplinary care plan developed or updated
- Disease-modifying pharmacotherapy (DMP) for ALS discussed
- ALS cognitive and behavioral impairment screening
- ALS symptomatic therapy treatment offered
- ALS respiratory insufficiency querying and referral for pulmonary function testing
- ALS noninvasive ventilation treatment for respiratory insufficiency discussed
- ALS screening for dysphagia, weight loss and impaired nutrition
- ALS nutritional support offered
- ALS communication support referral
- ALS end-of-life planning assistance
- ALS falls querying

Work group members reviewed the 2013 ALS measurement set and input from the small work group on review of evidence. The work group members then proposed 44 draft concepts (prior 2013 measure concepts and new concepts) which were gathered into 23 concept groupings. For example, 3 concepts were received and grouped into ventilation monitoring:

1. Patients who were screened for issues with secretions and noninvasive ventilation tolerability and device data that were downloaded to look for airway obstructive events
2. Patients who were referred at least once annually to a neurologist, pulmonologist, or mental health professional to evaluate patients' interest in receiving a tracheotomy and mechanical ventilation for sustaining life
3. Patients who were dependent on a ventilator and referred at least once annually to a speech-language pathologist (SLP) or assistive technology specialist to discuss locked-in syndrome

The 23 concept groupings addressed advance care planning, ALS supports, aspiration, assistive technology, caregiver burden, clinical trials, cognition, communication, diagnosis, diet and nutrition, DMP, exercise, falls, fatigue, foot drop, gait/motor assessment, genetic testing, home safety, multidisciplinary care, respiratory assessment, spasticity, symptom assessment, ventilation monitoring.

The work group ranked these concepts for development using a modified Delphi process to prioritize concepts that were meaningful for quality improvement, supported by evidence, and feasible to collect. After reviewing initial rankings, the work group revised the concepts into 12 groupings for further consideration. During this discussion, work group members agreed to remove the diagnosis concept. The work group members noted feasibility concerns of capturing data and limited ability to use the data to drive meaningful change at an individual clinician level because this relates to monitoring patients from symptom onset to diagnosis. Advance care planning and falls measures were removed from consideration as there are existing measures that clinicians may use for patients with ALS. These measures are included in the AANI's comprehensive neurology measurement set.¹² Additionally, there is a cross-cutting quality-of-life outcome measure that may be of interest to clinicians.¹³ The work group also noted that guidelines and more research are needed to address functional and integrative nutrition, specialized diets, and supplements, which could be considered for measure concepts in future iterations of this measurement set.

The work group then rated the remaining 12 concepts for feasibility, evidence, and meaningfulness for quality improvement. The 12 concepts moved forward for modified Delphi rating were ALS supports, caregiver burden, clinical trial, diet and nutrition, DMP, genetic testing, mobility, multidisciplinary care, needs assessment, respiratory care, and symptom assessment.

Following review of ratings, the work group did not advance caregiver burden, mobility, needs assessment, and symptom assessment. It was noted that a caregiver burden measure would be difficult to implement given documentation concerns. Information on caregiver burden screens is infrequently documented in a patient chart. Additionally, individual planning would need to occur to best address caregiver burden. For example, a patient and their care partner may benefit more from linkage to physical therapy to learn how to appropriately transfer and avoid injury than from a standard discussion on burnout. It would be difficult to quantify in the way that is meaningful for measurement as a personalized approach needed for patients and there is potential to burden clinicians to change documentation practices for feasibility to collect data. The work group did not develop mobility, needs assessment, or symptom assessment noting these concepts may be addressed through the multidisciplinary care umbrella. These concepts are of high value, but it is impossible to create math equations to address quality of care for all aspects of care. It is important that clinicians are performing standard speech-language pathology assessment, referring patients for speech banking as soon as they are diagnosed, having ongoing mobility, foot drop, and falls assessment in the multidisciplinary or interdisciplinary framework. The work group was charged with identifying and creating quality measures that are feasible to capture, meaningful for quality improvement, and supported by evidence. This is a difficult process, and many concepts could not be developed based on AANI development constraints.

Following the winnowing of concepts, the work group then proceeded to meet virtually to discuss 6 measure concepts:

- Therapies (addressing 2 potential components)
 - DMP
 - Clinical trials (removed following public comment)
- ALS supports
- Dietetic/nutrition care
- Genetic testing (removed following public comment)
- Multidisciplinary care (noting that some concepts not advanced maybe incorporated into this concept)
- Respiratory care—The work group discussed 2 potential concepts. The first focused on early intervention which was advanced for public comment and the second addressed patients who were started on non-invasive ventilation who were screened regularly for secretions, mask/device settings, tolerability and communication concerns. The work group tried to combine both concepts, but the denominator populations were sufficiently different requiring 2 measures, and it was noted that collection of both would pose a large burden on clinicians and practices. The concept may be revisited and developed in a future iteration of this measurement set.

Following the public comment, responses were drafted for individuals who commented, and measures refined as appropriate.

The work group removed the “Genetic testing offered following genetic counseling for patients with ALS” from further development following public comment because of lack of published evidence that this is best practice. Nevertheless, work group members recognize the value of routinely offering genetic testing to all patients with ALS patients, with the potential to identify a genetic cause for disease in 10-15% of all patients (irrespective of the presence of a family history), the potential implications for family members if a genetic cause of disease is identified, and the opportunity that a positive genetic test result would yield for participation in the growing number of observational studies and clinical trials focused on the genetic ALS population.¹⁴⁻¹⁷ It is hoped that in future updates of this measurement set the concept will be reassessed for development as evidence evolves. The work group is aware of 1 consensus guideline project in process that would be beneficial for future measure development.

The work group removed the “Clinical trials (CTs) or expanded access programs (EAPs) discussion for patients with ALS” measure from further development following public comment given lack of published evidence that this is best practice. It is hoped that in future updates of this measurement set the concept will be reassessed for development as evidence evolves.

Amyotrophic Lateral Sclerosis (ALS) Support Services

Measure Title	Amyotrophic lateral sclerosis (ALS) support services	
Description	Percentage of patients or care partners of patients diagnosed with ALS provided information about ALS support services at least once annually.	
Measurement Period	January 1, 20xx to December 31, 20xx	
Eligible Population	Eligible Providers	Medical doctor (MD), doctor of osteopathy (DO), advanced practice registered nurse (APRN), case manager, clinic coordinator, medical assistant, nurse, physical therapist, physician assistant (PA), occupational therapy practitioner, office assistant, registered dietitian nutritionist, respiratory therapist, speech-language pathologist, social worker
	Care Setting(s)	Outpatient care
	Ages	All
	Event	Office or telehealth encounter
	Diagnosis	ALS phenotypes characterized by appropriate ICD codes
Denominator	Patients or care partners of patients diagnosed with ALS phenotypes characterized by appropriate ICD codes	
Numerator	<p>Patients or care partners provided information on ALS support services^a at least once annually.</p> <p>NOTE: The following list of resources was developed at time of publication and may not be current. The work group is unable to provide an exhaustive list of supports and resources as this information will evolve over time. Further, treatment team members should individualize support and resource suggestions for each patient. For example, some patients may benefit from linkage to ALS community groups, while others may benefit more from provision of resources about how to effectively care for the patient to the primary care partner. Patients and care partners who do not speak or read English will also require individualized intervention to ensure written materials that meet their needs are provided. For measurement purposes this should occur at least once in the calendar year to ensure individualized resources are meeting patient and care partner needs but may need to occur more often to meet individual needs. The work group has identified the following supports and resources that could be useful:</p> <ul style="list-style-type: none"> • ALS Association (https://www.als.org/) • I AM ALS (https://iamals.org/) • Your ALS Guide (youralsguide.com) • Les Turner ALS Foundation Education (https://lesturnerals.org/als-decision-tools-guides-and-webinars/) • Team Gleason (http://www.teamgleason.org) • National ALS Registry (https://www.cdc.gov/als/Default.html) • National Institute of Neurological Disorders and Stroke (NINDS) (https://www.ninds.nih.gov/Disorders/All-Disorders/Amyotrophic-Lateral-Sclerosis-ALS-Information-Page) • Muscular Dystrophy Association (https://www.mda.org/disease/amyotrophic-lateral-sclerosis) • International Alliance of ALS/MND Associations (https://www.als-mnd.org) • I AM ALS Signal (www.iamals.org/alssignal) • ALS Therapy Development Institute (https://www.als.net/als-research/als-clinical-trials/) 	

	<ul style="list-style-type: none"> • <i>Brain & Life</i> (https://www.brainandlife.org/disorders-a-z/amyotrophic-lateral-sclerosis-als/) • Regional resources may include: <ul style="list-style-type: none"> ○ The Les Turner ALS Foundation (https://lesturnerals.org/) ○ ALS Hope Foundation (https://www.alshf.org/) ○ Compassionate Care ALS (https://ccals.org/) ○ Project ALS (https://projectals.org/) ○ Joan Dancy & PALS Foundation (http://joandancyandpals.org/) ○ ALS Association (https://www.als.org/) - Regional resources may include PALS for Life <p>^aALS supports services is defined as written or electronic material highlighting ALS patient or care partner services, which should be individualized, that is shared physically or digitally with patients or care partners.</p>
Required Exclusions	None
Allowable Exclusions	None
Exclusion Rationale	Not applicable
Measure Scoring	Percentage
Interpretation of Score	Higher score indicates better quality
Measure Type	Process
Level of Measurement	Provider
Risk Adjustment	None
Risk Stratification	Not applicable
Opportunity to Improve Gap in Care	<p>National Institute for Health and Care Excellence guidelines support linking ALS patients and their caregivers to ALS supports and resources.¹ There is an opportunity to improve the linkage for patients and care partners to ALS supports and resources. Resource information is most useful for patients when presented at key points in their disease course, especially shortly after diagnosis.</p> <p>The work group notes that delivery of this information can be overwhelming in a typical clinic visit. Printed materials are helpful to ensure patients and care partners are able to connect with resources after the visit. This information may be delivered by a variety of professionals (see list of eligible providers above), and it is noted that for performance measurement this action may be attributed to the treating clinician through use of a planned visit model or after visit summary.</p>
Relationship to Desired Outcome	Linkage to support groups has been demonstrated to improve outcomes for other disease states and it is anticipated that similar linkages for patients and care partners with ALS will lead to improved outcomes. ² Cordesse, et al., supports that an established connection to network care can improve outcomes for patients with ALS. ³ Care partners for patients with ALS are known to develop psychological difficulties that increase over time and are affected by social supports. ⁴ It has been shown in one study ³ that by providing ALS support service resources to patients and care partners, a connection will be made to

	<p>additional social supports and improve quality of life and reduce social isolation and psychological distress.</p>  <pre> graph LR A["Process Treatment team provides input on ALS supports and resources"] --> B["Intermediate outcome Patient confirms they were provided with information on ALS supports and resources"] B --> C["Outcome Patient connected to ALS supports and resources Care partner(s) connected to ALS supports and resources Improved quality of life"] </pre>
Harmonization with Existing Measures	There are no known similar measures.

Disease-Modifying Pharmacotherapy (DMP) Discussion with Patients with Amyotrophic Lateral Sclerosis (ALS)

Measure Titles	Disease-modifying pharmacotherapy (DMP) discussion with patients with amyotrophic lateral sclerosis (ALS)	
Descriptions	Percentage of patients with a diagnosis of ALS with whom the clinician discussed DMP (i.e., riluzole, edaravone, sodium phenylbutyrate/taurursodial, or other medication approved by the Food and Drug Administration [FDA]) at least once annually.	
Measurement Period	January 1, 20xx to December 31, 20xx	
Eligible Population	Eligible Providers	Medical doctor (MD), doctor of osteopathy (DO), advanced practice registered nurse (APRN), physician assistant (PA)
	Care Setting(s)	Outpatient care
	Ages	All
	Event	Office or telehealth encounter
	Diagnosis	ALS phenotypes characterized by appropriate ICD codes
Denominator	Patients diagnosed with ALS phenotypes characterized by appropriate ICD codes	
Numerator	<p>Patients with whom the clinician discussed DMP (i.e., riluzole, edaravone, sodium phenylbutyrate/taurursodial, or other FDA-approved medication) at least once annually.</p> <p>NOTE: The list of medication names above is based on clinical guidelines and other evidence at time of publication and may not be current. Medications approved for treatment are rapidly evolving, and clinicians should confirm with the FDA which medications are currently approved for use in patients diagnosed with ALS since the release of this measurement set. Clinicians and health care professionals should also refer to the FDA web site page entitled “Drug Safety Communications” for up-to-date drug recall and alert information when prescribing medications.</p>	
Required Exclusions	None	
Allowable Exclusions	None	
Exclusion Rationale	Not applicable

Interpretation of Score	Higher score indicates better quality	
Measure Type	Process	
Level of Measurement	Provider	
Risk Adjustment	None	
Risk Stratification	Not applicable	
Opportunity to Improve Gap in Care	<p>Multiple DMPs have been approved by the FDA for treatment of ALS, and it is expected that additional DMPs will be developed and approved in the coming years. There remains opportunity to improve access and use of DMPs for patients with ALS.</p> <p>Riluzole use ranges from a low of 38% of ALS patients in Muscular Dystrophy Association ALS Clinics to 63% of participants in the Centers for Disease Control and Prevention ALS Registry with 13% of patients stopping riluzole.^{1,2} ALS patients participating in clinical trials entered into the PRO-ACT database have higher use of riluzole at 78%.³ Edaravone use ranges from 19% in the USA safety database to 27% in a Veterans Affairs database.^{4,5} In one</p>	

	<p>clinical trial, edaravone use was 25%.⁶ Sodium phenylbutyrate/taurursodiol has been recently approved by the FDA and demonstrated to slow functional decline.⁷</p>
<p>For Process Measures Relationship to Desired Outcome</p>	<p>It is expected that by tracking discussions regarding DMP, patients will have earlier and increased access to appropriate patient-specific interventions and therapies that can lead to prolonged survival and improved quality of life.</p> <p>Clinical practice guidelines support the use of riluzole.⁸⁻¹⁰ Additional DMPs have been released and approved by the FDA since the 2009 American Academy of Neurology practice parameter update was published. Edaravone use is supported through Class I and II studies.¹⁰⁻¹⁶</p> <p>Patients with ALS participating in clinical trials may have a prolonged survival associated with higher use of DMPs (riluzole 78%, edaravone 25% [Class III evidence])^{3,6,17} compared with nonparticipants.</p> <div data-bbox="344 655 1471 928" data-label="Diagram"> <pre> graph LR A[Process Patients informed of therapies annually] --> B[Intermediate outcome DMP initiated] B --> C[Outcome Prolonged patient survival Enhanced quality of life Optimized health care delivery] </pre> </div>

The presence of key phrases in the clinical notes may meet the numerator component for the Axon Registry[®]. Suggested key phrases for potential use in the Axon Registry[®] are included below. This list is not exhaustive and will be updated annually if adopted into the Axon Registry[®]:

- “Patient DMP options reviewed”
- “Patient DMP changed following discussion”
- “Patient provided DMP counseling”
- “Discussed riluzole during visit”
- “Discussed riluteck during visit”
- “Discussed tiglutik during visit”
- “Discussed exservan during visit”
- “Discussed edaravone during visit”
- “Discussed radicava during visit”
- “Discussed radicut during visit”
- “Discussed albriozza during visit”
- “Discussed relyvrio during visit”
- “Discussed sodium phenylbutyrate/taurursodiol during visit”

Screening for Malnutrition and Dysphagia and Appropriate Referral for Patients with Amyotrophic Lateral Sclerosis (ALS)

Measure Title	Screening for malnutrition and dysphagia and appropriate referral for patients with amyotrophic lateral sclerosis (ALS)	
Description	Percentage of patients with ALS who were screened every 3 months (\pm 30 days) for malnutrition and dysphagia and, if screening positive (reporting signs and symptoms of declining nutrition status and/or dysphagia), referral to appropriate specialist documented on date of positive screening.	
Measurement Period	January 1, 20xx to December 31, 20xx	
Eligible Population	Eligible Providers	Medical doctor (MD), doctor of osteopathy (DO), advanced practice registered nurse (APRN), physical therapist, physician assistant (PA), occupational therapy practitioner, registered dietitian nutritionist (RDN), speech-language pathologist (SLP)
	Care Setting(s)	Outpatient care
	Ages	All
	Event	Office or telehealth encounter
	Diagnosis	ALS phenotypes characterized by appropriate ICD codes
Denominator	Patients diagnosed with ALS phenotypes characterized by appropriate ICD codes	
Numerator	<p>Patients who were screened every 3 months (\pm 30 days) for malnutrition^a and dysphagia^b and, if screening result was positive (reporting signs and symptoms of declining nutrition status and/or dysphagia), referral to appropriate specialist^c documented on date of positive screening.</p> <p>^aMalnutrition screening is defined as an assessment that addresses at least 2 components: unintended weight loss, dehydration, temporal wasting, and/or other visual signs of malnutrition OR administering any one of these tools:</p> <ul style="list-style-type: none"> • Nutrition Risk Score (NRS) (NRS-2002)¹ • Malnutrition Universal Screening Tool (MUST)¹ • Mini-Nutrition Assessment - Short Form (MNA-SF)¹ • Malnutrition Screening Tool (MST)¹ • Simple 2 Part Tool & Malnutrition Screening Tool¹ <p>^bDysphagia screening is defined as administering any one of these tools:</p> <ul style="list-style-type: none"> • Eating Assessment Tool-10 (EAT-10)² • ALS Severity Scale – Swallowing Subscale² • Neuromuscular Disease Swallow Status Scale (NdSSS)² • Oral motor exam (I&I Test)² • Iowa Oral Performance Instrument (IOPI)² • Center for Neurologic Study Bulbar Function Scale (CNS-BFS)² • Yale Swallow Protocol² • Revised SwalQoL-FS² • Revised ALS Functional Rating Scale (ALSFRS-R) Items 3 & 5⁴ <p>^cReferral to appropriate specialist is defined as referral to specialist as indicated in the current NEALS bulbar dysfunction guideline.² Individuals being seen at a multidisciplinary clinic do not need additional referral and meet the numerator.</p>	
Required Exclusions	None	
Allowable Exclusions	<ul style="list-style-type: none"> • Patient declines malnutrition screening or follow-up • Patient declines dysphagia screening or follow-up 	
Exclusion Rationale	Patients need to be willing to complete screening for impairment to be identified and, patients may decline referral due to patient care preferences despite screening positive,	

	which would warrant exclusion from calculation. Patients without insurance may decline screening and referral and would also be appropriate to exclude as a result.
Measure Scoring	Percentage
Interpretation of Score	Higher score indicates better quality
Measure Type	Process
Level of Measurement	Provider
Risk Adjustment	None
Risk Stratification	Not applicable
Opportunity to Improve Gap in Care	<p>Evidence supports an opportunity to improve screening for malnutrition and dysphagia symptoms and improve intervention for patients with concerns identified.³⁻⁷</p> <p>Patients should be screened by an appropriately trained clinician (e.g. RDN, SLP) or via validated tools for malnutrition and dysphagia as soon as possible; this may occur at initial workup for suspected ALS, at the first visit during which ALS is diagnosed, or at the first feasible visit for patients diagnosed with ALS. These screenings should be conducted at least every 3 months (\pm 30 days) and may be done more frequently to meet individual patient needs. Any properly trained health professional can use the above-mentioned validated screening tools to conduct the initial screening and refer the patient and care partner to the appropriate professional for education and counseling as indicated.^{2,8-10}</p> <p>When defining malnutrition screening, the work group noted that muscle wasting and grip strength are cardinal signs and symptoms of ALS progression and are frequently documented outside of a malnutrition screening. As a result, these terms were excluded from the list of malnutrition screening components intentionally because including it may artificially inflate performance rates. The measure will be monitored for unintended consequences and updates discussed at the next triennial review. Clinicians are encouraged to assess for muscle wasting and grip strength as part of the malnutrition screening.</p> <p>The work group notes there may be a chance of false-positive screening results as an unintended consequence of measurement. False-positive results are preferable to the alternative of missed opportunities for earlier intervention. The work group tried to identify brief screening tools completed in 5–10 minutes when possible and decided that the EAT-10 or SwalQoL revised FS could be implemented using a planned visit model to reduce implementation burden on physicians.^{3,7,11} Use of standardized tools requires rigorous adherence to the methods. Physicians and clinicians should be adept at methods before implementing a quality measure that requires use of a standardized tool. Tools may be subject to copyright and require licensing fee.</p>
For Process Measures Relationship to Desired Outcome	Guidelines support the screening for malnutrition and dysphagia symptoms and intervention following positive screening. ^{2,8-10} It is expected that by screening early and often for malnutrition and dysphagia symptoms, patients will have earlier and increased access to appropriate specialists to help address patient-specific symptoms. By addressing patient-specific symptoms earlier, increased interventions may be provided that can lead to prolonged survival and improved quality of life. ¹²⁻¹⁸

Screening for Respiratory Impairment and Appropriate Intervention for Patients with Amyotrophic Lateral Sclerosis (ALS)

Measure Title	Screening for respiratory impairment and appropriate intervention for patients with amyotrophic lateral sclerosis (ALS)	
Description	Percentage of patients with ALS screened every 3 months (± 30 days) or more frequently as clinically indicated for respiratory impairment and cough strength, and if screening result is positive for any impairments, discussed noninvasive respiratory support (e.g., noninvasive ventilation (NIV), assisted cough) with patients or referred for NIV.	
Measurement Period	January 1, 20xx to December 31, 20xx	
Eligible Population	Eligible Providers	Medical doctor (MD), doctor of osteopathy (DO), advanced practice registered nurse (APRN), physician assistant (PA), respiratory therapist (RT)
	Care Setting(s)	Outpatient and inpatient care
	Ages	All
	Event	Office or telehealth encounter and inpatient encounter
	Diagnosis	ALS phenotypes characterized by appropriate ICD codes
Denominator	Patients diagnosed with ALS phenotypes characterized by appropriate ICD codes	
Numerator	<p>Patients screened every 3 months (± 30 days) or more frequently as clinically indicated^a (e.g., rapid progression) for respiratory impairment and cough strength. If screening result is positive for any of the specified impairments,^b discussed noninvasive respiratory support (e.g., NIV, assisted cough) with patients or referred them for NIV.^c</p> <p>Suggested tools for screening respiratory impairment are the respiratory subscore from the revised Amyotrophic Lateral Sclerosis Functional Rating Scale (ALSFRS-R); the ALS respiratory symptom scale;^{1,2} pulmonary function testing, including vital capacity (VC) and maximal inspiratory pressure (MIP)/sniff nasal inspiratory pressure (SNIP); and peak cough flow. The work group notes that respiratory subscore alone should not trigger follow-up as there will be patients with a score of 1 who require discussion while others with a higher score would not warrant a discussion.</p> <p>^aFor inpatient care, this should be done once before discharge.</p> <p>^bAny single criterion is sufficient to initiate NIV³:</p> <ul style="list-style-type: none"> • Symptoms plus a VC < 80% (orthopnea, dyspnea, morning headache, daytime sleepiness, or unrefreshing sleep) • CO₂ measurement <ul style="list-style-type: none"> ○ Daytime/awake PaCO₂ ≥ 45 mm Hg via arterial blood gases ○ End-tidal carbon dioxide/transcutaneous carbon dioxide (ETCO₂/TCCO₂) or venous blood gas PCO₂ ≥ 50 mm Hg • Sleep-related oxygen saturation from any source, including polysomnography/home sleep test (HST) <ul style="list-style-type: none"> ○ $\leq 90\%$ for $\geq 5\%$ of the night ○ $\leq 88\% \geq 5$ min • VC (upright or supine, either forced VC or slow VC) <ul style="list-style-type: none"> ○ $\leq 50\%$ predicted • MIP/SNIP is less negative than the following values: <ul style="list-style-type: none"> ○ MIP ≤ -60 cm H₂O (equal or worse than) ○ SNIP ≤ -40 cm H₂O (equal or worse than) 	

	Time between positive screening result and referral should be within 4 weeks of encounter (i.e., date of encounter to 42 days postencounter).
Required Exclusions	Patient using noninvasive or invasive ventilation prior to encounter date
Allowable Exclusions	<ul style="list-style-type: none"> • Patient declines screening and/or referral for NIV on date of encounter • Patient unable to complete testing on date of encounter
Exclusion Rationale	Patients who are already using invasive ventilation would not need ongoing screening to determine appropriateness for NIV. Because this measure is focused on earlier identification of respiratory failure for the purposes of initiating NIV, patients already using noninvasive ventilation are excluded. Patients need to be willing to complete screening for respiratory impairment to be identified, and patients may decline referral for NIV because of patient care preferences, despite receiving a positive screening result for respiratory impairment. Patients without insurance may decline screening and referral, and it would be appropriate to exclude them as a result. There may be some situations where a patient is unable to complete testing such as having cognitive impairment or weak bulbar muscles that prevent adequate seal for pulmonary function testing, and these patients would be appropriate to exclude as a result.
Measure Scoring	Percentage
Interpretation of Score	Higher score indicates better quality
Measure Type	Process
Level of Measurement	Provider
Risk Adjustment	None
Risk Stratification	Not applicable
Opportunity to Improve Gap in Care	<p>The measure has been updated to reflect this most recent evidence. Although use of NIV in patients with ALS and respiratory impairment has been shown to improve survival,^{4,5} quality of life,^{4,5} and cognitive outcomes,⁶ use of NIV remains low.^{7,8} This measure aims to highlight this gap. Screening respiratory function every 3 months is recommended by the most recent guidelines,⁹ but the screening frequency should be individualized based on the rate of disease progression. Early initiation of NIV has been shown to prolong survival, improve adherence to NIV, and slow the rate of decline in FVC.¹⁰⁻¹⁴ Recent guidelines support broadening the criteria for initiating NIV to include a higher FVC threshold to > 65% predicted if asymptomatic or > 80% FVC predicted for patients who are symptomatic with dyspnea or orthopnea and for those with nighttime respiratory dysfunction.⁹ Both sets of guidelines support use of MIP, SNIP, and/or maximal expiratory pressure thresholds for consideration of NIV, and recent studies suggest that these pressure-based measurements may show an earlier steeper decline than FVC.^{15,16}</p> <p>Patients with impaired cough flow (< 270L/min) or difficulty clearing bronchial secretions, should be recommended for cough assist devices.⁹</p> <p>This measure is intended to capture the most critical existing gap in identifying respiratory dysfunction and early initiation of NIV and cough assist if it is within the patient's care preferences in keeping with recent guidelines.^{1,9} There is an ongoing gap related to comprehensive respiratory care of patients with ALS and respiratory impairment, including pharmacologic therapies (inhalers, nebulization), devices (high frequency chest wall oscillations, incentive respiratory training, lung volume recruitment, suction machine,</p>

	<p>nebulizer, mouthpiece ventilation, etc.), and appropriate respiratory therapist, physician, and technical support. While important, at present the work group felt capturing all these elements would not be feasible in our current measure data collection.^{9,17}</p> <p>The work group noted that recent guidelines also recommend reviewing and updating patient care preferences at significant time points in the patient’s illness, including development of respiratory impairment.¹⁸ Important decisions related to respiratory dysfunction include whether to initiate NIV, when to stop NIV in the disease course, whether tracheostomy is within the patient’s goals of care, and discussion of potential evolution to locked-in syndrome while on ventilatory support so that patients and families can anticipate each stage and determine their care preferences.¹⁹⁻²¹</p>
<p>For Process Measures Relationship to Desired Outcome</p>	<p>Use of NIV has been shown to prolong survival and enhance quality of life.^{4,5}</p>  <pre> graph LR A[Process Screened for respiratory impairment and cough strength Referred for NIV] --> B[Intermediate outcome Patients using NIV] B --> C[Outcome Prolonged patient survival Enhanced quality of life Improved cognitive function] </pre>
<p>Harmonization with Existing Measures</p>	<p>This measurement set also includes a multidisciplinary care measure that recommends including a respiratory therapist and pulmonologist as part of the multidisciplinary care team. This measure is complimentary to the multidisciplinary care measure in that screening is recommended as part of the multidisciplinary clinical evaluation, and this measure highlights the need for patients who receive a positive screening result to have a discussion of noninvasive respiratory support (e.g., NIV, assisted cough) or referral for NIV.</p>

Screening for respiratory impairment and appropriate intervention for patients with ALS: Measure flow

Screening for respiratory impairment and appropriate intervention for patients with ALS: Measure flow
(continued)

Screening for respiratory impairment and appropriate intervention for patients with ALS: 2022 Code systems and descriptions

The following code systems and code descriptions were developed by the work group in 2022. This information may evolve over time as Current Procedural Terminology (CPT), International Classification of Diseases, Tenth Revision (ICD-10), and Logical Observation Identifiers Names and Codes (LOINC) codes evolve. Please contact quality@aan.com for the most up to date coding resources for measure implementation.

Code System	Code	Code Description
Denominator		
CPT	99091	Collection and interpretation of physiologic data
CPT	94014-94016	Patient-initiated spirometric recording per 30-day period of time
CPT	99453	Remote monitoring of physiologic parameter(s) (e.g., weight, blood pressure, pulse oximetry, respiratory flow rate), initial; set-up and patient education on the use of equipment)
CPT	99454	Device(s) supply with daily recording(s) or programmed alert(s) transmission, each 30 days
CPT	99457	Remote physiologic monitoring treatment management services, clinical staff/ physician/ other qualified healthcare professional time in a calendar month requiring interactive communication with the patient/caregiver during the month; initial 20 min
CPT	99458	Remote physiologic monitoring treatment management services, clinical staff/ physician/ other qualified healthcare professional time in a calendar month requiring interactive communication with the patient/caregiver during the month; additional 20 min
CPT	94726-94729	Pulmonary Diagnostic Testing, Rehabilitation, and Therapies
CPT	99202-99205	Office or Other Outpatient Visit - New Patient (E/M Codes)
CPT	99211-99215	Office or Other Outpatient Visit - Established Patient (E/M Codes)
CPT	99221-99223	New or Established Patient Initial Hospital Inpatient Care Services
CPT	99231-99233	Inpatient hospital visits: Initial and subsequent
CPT	99241-99245	Office or Other Outpatient Consultation – New or Established Patient
CPT	99421-99423	Online digital evaluation and management service
CPT	99441-00443	Telephone evaluation and management service

Amyotrophic Lateral Sclerosis (ALS) Multidisciplinary Care Plan Developed or Updated

This measure is calculated at every visit

Measure Title	Amyotrophic lateral sclerosis (ALS) multidisciplinary care plan developed or updated	
Description	Percentage of visits with patients who have a primary diagnosis of ALS during which a multidisciplinary care plan ^a was either developed (if not done previously) OR reviewed and/or updated.	
Measurement Period	January 1, 20xx to December 31, 20xx	
Eligible Population	Eligible Providers	Medical doctor (MD), doctor of osteopathy (DO), advanced practice registered nurse (APRN), physician assistant (PA)
	Care Setting(s)	Outpatient care
	Ages	All
	Event	Office or telehealth encounter
	Diagnosis	ALS phenotypes characterized by appropriate ICD codes
Denominator	All outpatient and telehealth visits for patients with a primary diagnosis of ALS phenotypes characterized by appropriate ICD codes	
Numerator	<p>Visits during the calendar year during which a multidisciplinary care plan^a was either developed (if not done previously) OR reviewed and/or updated.</p> <p>^aA multidisciplinary care plan should address multiple facets of the disease, including respiratory function, nutrition, mobility, falls, mood, cognitive function, and communication. The plan should include input from a neurologist and at least 4 of the following specialists to address manifestations of disease: pulmonologist, gastroenterologist, physiatrist, social worker, occupational therapist, physical therapist, speech-language pathologist, psychologist, psychiatrist, respiratory therapist, genetic counselor, palliative care specialist, specialized nurse, dietitian, assistive technology specialist, or dentist.</p>	
Required Exclusions	None	
Allowable Exclusions	<ul style="list-style-type: none"> • Patient/caregiver declines multidisciplinary care plan. • Patients identified as not in current need of multidisciplinary care planning with an early, non-debilitating form of ALS (e.g., King’s Staging System, Stage 1) 	
Exclusion Rationale	Exclusions are needed for patients who decline multidisciplinary care. Patients must be willing to engage in this process for results to be valid. Patients without insurance may decline screening and referral and would be appropriate to exclude as a result. There are patients who might not benefit from multidisciplinary care planning, such as those in the early stages of ALS or who are at a stage of disease that is non-debilitating (e.g., sole symptom of foot drop).	
Measure Scoring	Percentage	
Interpretation of Score	Higher score indicates better quality	
Measure Type	Process	
Level of Measurement	Provider	
Risk Adjustment	None	
Risk Stratification	Not applicable	

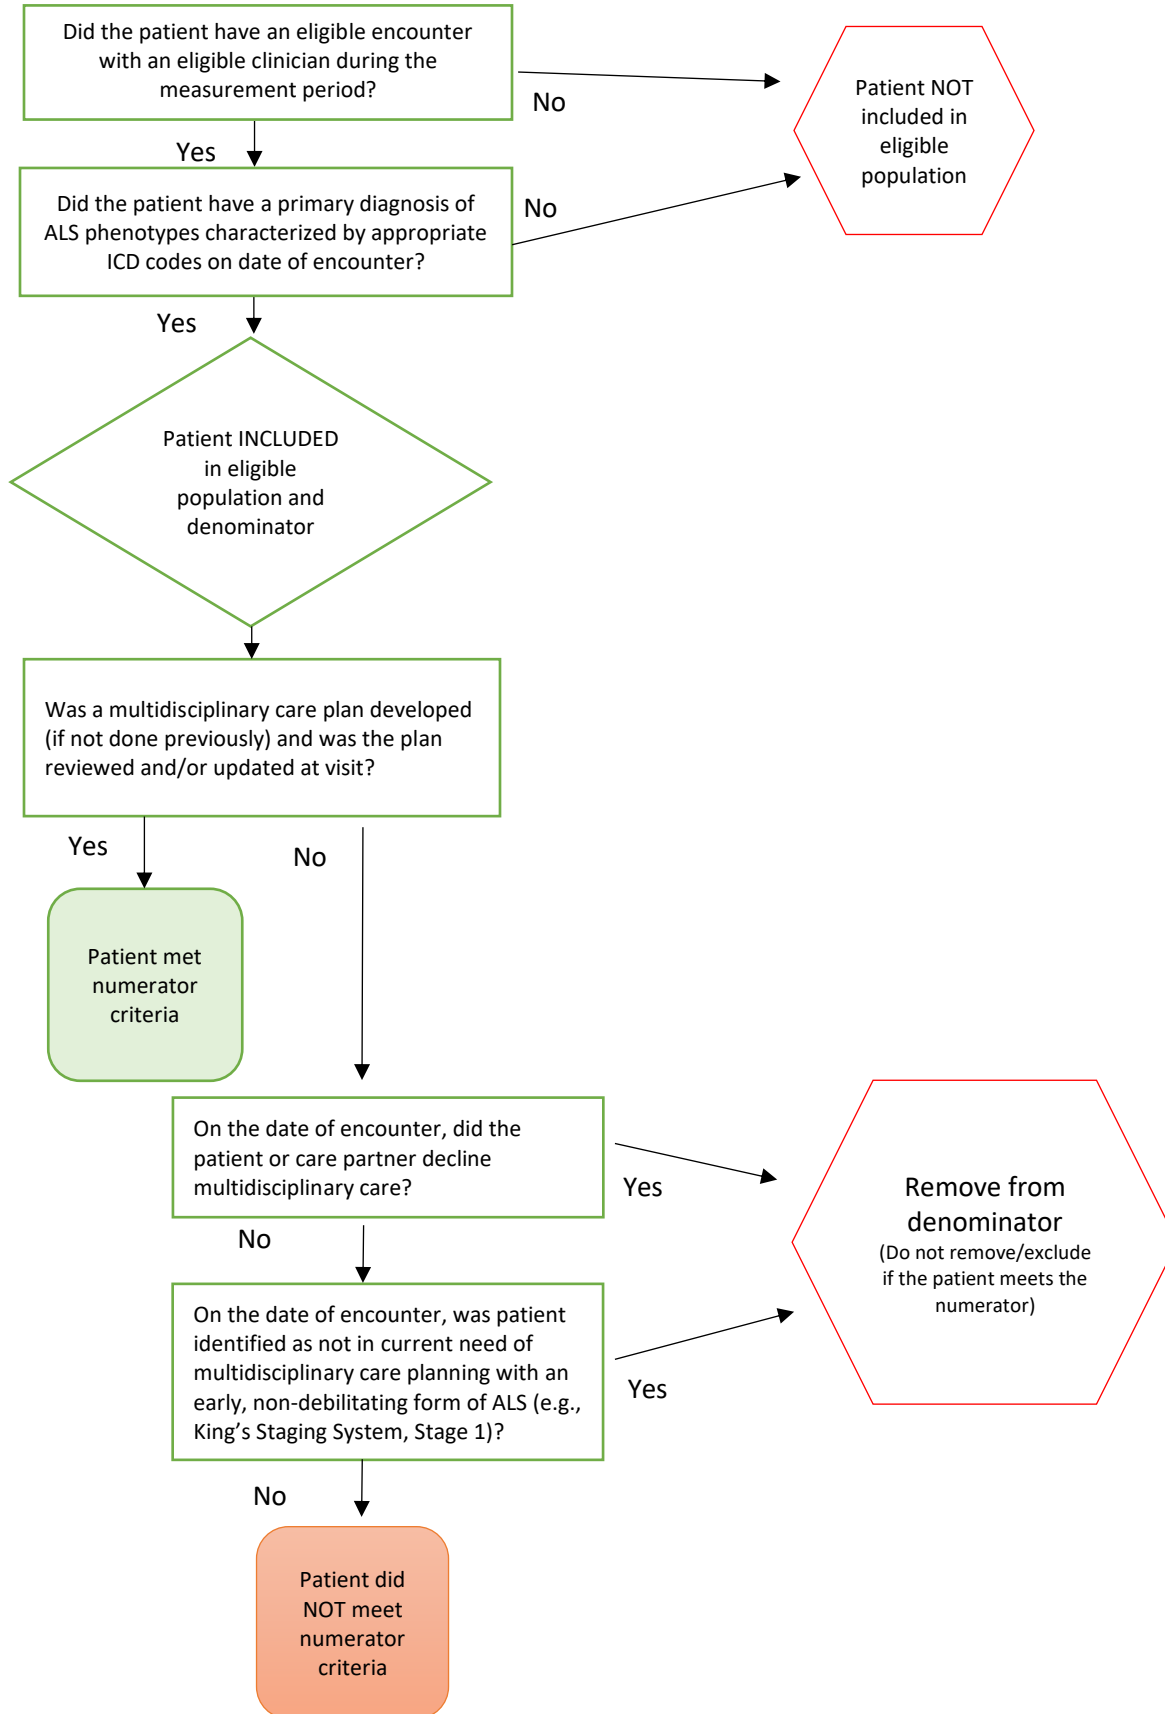

<p>Opportunity to Improve Gap in Care</p>	<p>Treatments for ALS are underused, even in specialized clinics.^{1,2} Studies suggest that even in tertiary care centers, there are varying degrees of adherence to the evidence-based parameters.¹⁻³ Studies show that there is a much higher utilization rate of evidence-based treatments in multidisciplinary clinics than in community-based care.^{2,4} Data are especially indicative of underuse of riluzole (60% of patients), percutaneous endoscopic gastrostomy (9%), and noninvasive ventilation (22%), with greatest gains in use occurring in the specialized ALS clinics.² Implementation of a multidisciplinary protocol showed less delay in initial assessment by a nutrition specialist and lower percentage of severe malnutrition in ALS patients.⁵ These important treatments lengthen life and improve quality of life, but they are neglected by many patients and health care professionals.^{1,2}</p> <p>Access to the limited number of ALS specialized clinics may involve long-distance travel which may be a barrier for some patients. Telemedicine might be a solution to this challenge. Selkirk, et al. found that patients seen via telemedicine received the same quality of care and had similar outcomes as patients who had in-person encounters.⁶ In a limited study, Schellenberg, et al. found that travel and mobility were cited by patients as a barrier to multidisciplinary care, and some patients expressed interest in telehealth services.⁷</p> <p>A study by Dandaba, et al. found a gap in services for older patients with ALS. These patients had less access and decreased referrals to ALS expert centers.⁸</p> <p>The work group evaluated expanding the eligible visits to include inpatient care but declined to expand measurement focus during this update. Inpatient clinicians are encouraged to conduct a review of treatment plans during admission. The work group also discussed excluding patients admitted to hospice, short-term nursing facilities, and palliative-care services. An exclusion was not developed after discussion because treatment planning review and updates should continue throughout the course of care.</p>
<p>For Process Measures Relationship to Desired Outcome</p>	<p>There is strong guideline support for multidisciplinary care for patients with ALS.^{4,9-13} It is expected that by tracking linkage to multidisciplinary care planning and regularly updating the plan that patients will have earlier and increased access to appropriate specialists to help address patient-specific symptoms. By addressing patient-specific symptoms earlier, increased interventions may be provided that can lead to prolonged survival and improved quality of life.</p> <div data-bbox="344 1346 1469 1713" data-label="Diagram"> <pre> graph LR subgraph Process_Box [Process] P1[ALS multidisciplinary care plan is developed] P2[ALS multidisciplinary care plan is reviewed and updated every visit] end subgraph Intermediate_Box [Intermediate outcome] I1[Connection with appropriate specialists] I2[Optimized healthcare delivery] I3[Symptoms addressed by appropriate specialists in a timely manner] end subgraph Outcome_Box [Outcome] O1[Prolonged patient survival] O2[Enhanced quality of life] O3[Optimized health care delivery] end Process_Box --> Intermediate_Box Intermediate_Box --> Outcome_Box </pre> <p>The diagram illustrates a three-stage process flow:</p> <ul style="list-style-type: none"> Process: ALS multidisciplinary care plan is developed; ALS multidisciplinary care plan is reviewed and updated every visit. Intermediate outcome: Connection with appropriate specialists; Optimized healthcare delivery; Symptoms addressed by appropriate specialists in a timely manner. Outcome: Prolonged patient survival; Enhanced quality of life; Optimized health care delivery. </div>
<p>Harmonization with Existing Measures</p>	<p>This represents an update to the existing AAN 2012 ALS Quality Measure Set Measure #1, “ALS Multidisciplinary care plan developed or updated.” There are no known similar measures.</p>

Amyotrophic Lateral Sclerosis (ALS) Patient Care Preferences

Measure Title	Amyotrophic lateral sclerosis (ALS) patient care preferences	
Description	Percentage of patients with ALS who were offered assistance in planning for end-of-life issues (e.g., advance directives, invasive ventilation, lawful physician-hastened death, or hospice) or whose existing end-of-life plan was reviewed and updated at least once annually or more frequently as clinically indicated (i.e., rapid progression).	
Measurement Period	January 1, 20xx to December 31, 20xx	
Eligible Population	Eligible Providers	Medical doctor (MD), doctor of osteopathy (DO), advanced practice registered nurse (APRN), physician assistant (PA)
	Care Setting(s)	Outpatient care
	Ages	All
	Event	Office or telehealth encounter
	Diagnosis	ALS phenotypes characterized by appropriate ICD codes
Denominator	Patients diagnosed with ALS phenotypes characterized by appropriate ICD codes	
Numerator	<p>Patients who were offered assistance in planning for end-of-life issues (e.g., advance directives, invasive ventilation, lawful physician-hastened death, or hospice) or whose existing end-of-life plan was reviewed and updated at least once annually or more frequently as clinically indicated (i.e., rapid progression).</p> <p>Assistance with end-of-life issues is defined as an assessment of patient concerns, desires, and needs relating to end-of-life issues. Based on patient’s disease progression, this may include discussions regarding invasive ventilation, advance directives, lawful physician hastened death, or hospice.</p>	
Required Exclusions	Admitted to hospice	
Allowable Exclusions	Annual discussion not clinically indicated	
Exclusion Rationale	Patients admitted to hospice would not require annual assessment of patient care preferences. There are some patients for whom an annual discussion and update of end-of-life care planning is not clinically indicated.	
Measure Scoring	Percentage	
Interpretation of Score	Higher score indicates better quality	
Measure Type	Process	
Level of Measurement	Provider	
Risk Adjustment	None	
Risk Stratification	Not applicable	
Opportunity to Improve Gap in Care	<p>Since it was released in 2013, the quality measure has been adopted by the Centers for Medicare & Medicaid Services in their Quality Payment Program. The measure has not been identified as topped-out. The measure was also implemented in the American Academy of Neurology Institute’s (AANI) Axon Registry®, and review of average performance scores indicated a continued gap in care: the 2018 average performance, excluding zero denominator from 8 clinicians, was 53.59%; the 2019 average performance, excluding zero denominator from 149 clinicians, was 48.8%; and the 2020 average</p>	

	performance, excluding zero denominator from 105 clinicians, was 73.92%. Evidence supports there is a continued gap to address for inpatient and outpatient clinicians. ¹⁻⁵
For Process Measures Relationship to Desired Outcome	<p>Clinical practice guidelines continue to stress the importance of end-of-life planning for patients with ALS and their care partners, but guidelines for discussions about end-of-life care for patients with ALS have not been published.^{1,6,7} In 2022, the AANI released a position statement, Clinical Guidance in Neuropalliative Care, that encourages clinicians to engage in neuropalliative planning at an early stage, given the poor prognosis and likelihood of difficulty expressing a desire to shift the focus of care as the disease progresses.⁸</p>  <pre> graph LR A[Process End-of-life planning discussed] --> B[Intermediate outcome Advance directive created Linked to palliative services] B --> C[Outcome Improved quality of life Holistic management of symptoms for patients with terminal illness] </pre>
Harmonization with Existing Measures	There are no known similar measures.

ALS patient care preferences: Measure flow

ALS patient care preferences: 2022 code systems and descriptions

The following code systems and code descriptions were developed by the work group in 2022. This information may evolve over time as Current Procedural Terminology (CPT), International Classification of Diseases, Tenth Revision (ICD-10), and Logical Observation Identifiers Names and Codes (LOINC) codes evolve. Please contact quality@aan.com for the most up to date coding resources for measure implementation.

Code System	Code	Code Description
Denominator		
CPT	99202-99205	Office or Other Outpatient Visit - New Patient (E/M Codes)
CPT	99211-99215	Office or Other Outpatient Visit - Established Patient (E/M Codes)
CPT	99241-99245	Office or Other Outpatient Consultation – New or Established Patient
CPT	99421-99423	Online digital evaluation and management service
CPT	99441-00443	Telephone evaluation and management service
AND		
ICD-10-CM	G12.21	Amyotrophic lateral sclerosis
ICD-10-CM	G12.22	Progressive bulbar palsy
ICD-10-CM	G12.23	Primary lateral sclerosis
ICD-10-CM	G12.24	Familial motor neuron disease
ICD-10-CM	G12.25	Progressive spinal muscle atrophy
SNOMED	86044005	Amyotrophic lateral sclerosis (disorder)
SNOMED	1201863001	Amyotrophic lateral sclerosis type 1 (disorder)
SNOMED	1201950008	Amyotrophic lateral sclerosis type 3 (disorder)
SNOMED	784341001	Amyotrophic lateral sclerosis type 4 (disorder)
SNOMED	1204334005	Amyotrophic lateral sclerosis type 6 (disorder)
SNOMED	1204349002	Amyotrophic lateral sclerosis type 7 (disorder)
SNOMED	1204350002	Amyotrophic lateral sclerosis type 8 (disorder)
SNOMED	1204351003	Amyotrophic lateral sclerosis type 9 (disorder)
SNOMED	1208412003	Amyotrophic lateral sclerosis type 10 (disorder)
SNOMED	54304004	Progressive bulbar palsy (disorder)
SNOMED	230246005	Progressive bulbar palsy of childhood (disorder)
SNOMED	699866005	Progressive bulbar palsy with sensorineural deafness (disorder)
SNOMED	81211007	Primary lateral sclerosis (disorder)
SNOMED	717964007	Juvenile primary lateral sclerosis (disorder)
SNOMED	49793008	Hereditary motor neuron disease (disorder)
Denominator – Required Exclusions		
HCPCS	G9758	Admitted to hospice
HCPCS	G9858	Patient enrolled in hospice
CPT II	G9760, G9761, G9805, G9809, G9819	Patients who use hospice services any time during the measurement period.
CPT II	G9688	Patients using hospice services any time during the measurement period
CPT II	G9690	Patient receiving hospice service any time during the measurement period
CPT II	G9692	Hospice services received by patients any time during the measurement period
CPT II	G9693	Patient use of hospice services any time during the measurement period

CPT II	G9694	Hospice service utilized by patient any time during the measurement period
SNOMEDCT	103735009	Palliative care (regime/therapy)
SNOMEDCT	182964004	Terminal care (regime/therapy)
SNOMEDCT	306676000	Discharge from hospice (procedure)
SNOMEDCT	306681009	Discharge from hospice day hospital (procedure)
SNOMEDCT	170935008	Full care by hospice (finding)
SNOMEDCT	170936009	Shared care - hospice and general practitioner (finding)
SNOMEDCT	183919006	Urgent admission to hospice (procedure)
SNOMEDCT	183920000	Routine admission to hospice (procedure)
SNOMEDCT	183921001	Admission to hospice for respite (procedure)
SNOMEDCT	1891000124102	Transition from acute care to hospice (finding)
SNOMEDCT	1961000124102	Transition from hospice to home-health care (finding)
SNOMEDCT	1971000124109	Transition from hospice to acute care (finding)
SNOMEDCT	1981000124107	Transition from hospice to long-term care (finding)
SNOMEDCT	284546000	Hospice (environment)
SNOMEDCT	305336008	Admission to hospice (procedure)
SNOMEDCT	305911006	Seen in hospice (finding)
SNOMEDCT	441874000	Seen by palliative care service (finding)
SNOMEDCT	444933003	Home hospice service (qualifier value)
LOINC	100018-1	Hospice care Note
LOINC	45755-6	Hospice care [Minimum Data Set]
LOINC	54709-3	Hospice considered appropriate [CARE]
LOINC	55012-9	Hospice care in last 14 days - while not a resident [MDSv3]
LOINC	55013-7	Hospice care in last 14 days - while a resident [MDSv3]
LOINC	85595-7	Will hospice care be provided
SNOMEDCT	373066001	Yes (qualifier value)
<p>The presence of key phrases in clinical notes may meet the required exclusion component for the Axon Registry®. Suggested key phrases for potential use in the Axon Registry® are included below. This list is not exhaustive and will be updated annually if adopted into the Axon Registry®:</p> <ul style="list-style-type: none"> • “Patient admitted to dying care” • “Patient admitted to hospice care” • “Patient admitted to palliative care” • “Patient admitted to terminal care” • “Patient discharged home from hospice care” 		
Denominator – Allowable Exclusions		
SNOMEDCT	713615000	Advance care planning declined (situation)
SNOMEDCT	716048005	Review of advance care plan declined (situation)
SNOMEDCT	714747005	Discussion about advance care planning declined (situation)
Numerator		
HCPCS	G9380	Patient offered assistance with end of life issues during the measurement period
HCPCS	G9382	Patient not offered assistance with end of life issues during the measurement period
HCPCS	4553F	Patient offered assistance in planning for end of life issues
LOINC	45473-6	Advance directive/living will completed
LOINC	45474-4	Advance directive - do not resuscitate [Minimum Data Set]
LOINC	45475-1	Advance directive - do not hospitalize [Minimum Data Set]
LOINC	45476-9	Advance directive - organ donation [Minimum Data Set]

LOINC	45477-7	Advance directive - autopsy request [Minimum Data Set]
LOINC	45478-5	Advance directive - feeding restrictions [Minimum Data Set]
LOINC	45479-3	Advance directive - medication restrictions [Minimum Data Set]
LOINC	45480-1	Advance directive - other treatment restrictions [Minimum Data Set]
LOINC	45481-9	Advance directive - none [Minimum Data Set]
LOINC	45986-7	Advance directives Set
LOINC	75320-2	Advance directive
LOINC	75787-2	Advance directive - request for intubation
LOINC	75788-0	Advance directive - request for tube feeding
LOINC	75789-8	Advance directive - request for life support
LOINC	75790-6	Advance directive - request for IV fluid and support
LOINC	75791-4	Advance directive - request for antibiotics
LOINC	75792-2	Advance directive - request for resuscitation that differs from cardiopulmonary resuscitation
LOINC	93442-2	Advance directive document format
SNOMEDCT	713580008	Review of advance care plan (procedure)
SNOMEDCT	713600001	Agreement on advance care plan (procedure)
SNOMEDCT	713603004	Advance care planning (procedure)
SNOMEDCT	713604005	Education about advance care planning (procedure)
SNOMEDCT	713662007	Discussion about advance care planning (procedure)
SNOMEDCT	713673000	Has end of life care plan (finding)
SNOMEDCT	714748000	Has advance care plan (finding)
SNOMEDCT	715016002	Advance care planning request by patient (procedure)
SNOMEDCT	736366004	Advance care plan (record artifact)
SNOMEDCT	736373009	End of life care plan (record artifact)
SNOMEDCT	425392003	Active advance directive (finding)
SNOMEDCT	310305009	Active advance directive (copy within chart) (finding)
SNOMEDCT	310302007	Advance directive discussed with patient (finding)
SNOMEDCT	310303002	Advance directive discussed with relative (finding)
SNOMEDCT	425396000	Active advance directive with verification by family (finding)
SNOMEDCT	425394002	Active healthcare will (finding)
SNOMEDCT	425395001	Active living will (finding)
SNOMEDCT	87691000119105	Comfort care only status (finding)
SNOMEDCT	697978002	Provider orders for life-sustaining treatment (record artifact)
SNOMEDCT	365870005	Finding of resuscitation status (finding)
SNOMEDCT	143021000119109	Do not resuscitate status with supporting documentation (finding)
SNOMEDCT	385763009	Hospice care (regime/therapy)
SNOMEDCT	719414000	Referral to hospice at home service (procedure)
SNOMEDCT	734280006	Provision of written information about hospice service (procedure)
SNOMEDCT	363676003	Palliative - procedure intent (qualifier value)
SNOMEDCT	773981004	Palliative care plan (record artifact)
SNOMEDCT	310073009	Palliative care service (qualifier value)
SNOMEDCT	306237005	Referral to palliative care service (procedure)

The presence of key phrases in clinical notes may meet the numerator component for the Axon Registry®. Suggested key phrases for potential use in the Axon Registry® are included below. This list is not exhaustive and will be updated annually if adopted into the Axon Registry®:

- “Advance care directive reviewed”
- “Advance directive assistance and planning”
- “Assistance in end of life planning”
- “Assistance on end of life issues”

- “Assistance on planning for hospice”
- “Has DNI form filled out”
- “Has DNR form filled out”
- “Has MOLST form filled out”
- “Has POLST form filled out”
- “Healthcare power of attorney reported”
- “Palliative care discussed”
- “Advanced directive reviewed”
- “Advance directive reviewed”
- “Advance care plan reviewed”
- “Advanced care plan reviewed”
- “Discussion about Hospice”
- “Palliative care discussed”
- “Provider offered assistance about hospice”
- “Discussion of invasive ventilation”
- “Respiratory support”
- “Terminal dyspnea”
